

LOW-CODE APPLICATION DEVELOPMENT USING ZOHOCREATOR

EXPERIMENT -1

NAME : JAIGANESH G

ROLL NO:240701202

1. Aim

To study and compare the Traditional Application Development approach with the Zoho Low-Code Development approach based on their development process, coding effort, development time, cost, maintenance, and overall efficiency.

2. Introduction to Traditional Approach

Traditional Application Development is the conventional method of building software by writing source code manually using programming languages such as Java, Python, C#, PHP, and JavaScript. The entire application, including the user interface, business logic, database connectivity, and security, is developed through coding.

This approach follows the Software Development Life Cycle (SDLC), which includes requirement analysis, design, coding, testing, deployment, and maintenance. It provides complete flexibility and customization but requires skilled developers, more development time, and higher costs.

3. Introduction to Low-Code

Low-Code Development is a modern software development approach that enables developers to build applications with minimal manual coding. Instead of writing large amounts of code, developers use visual interfaces, drag-and-drop components, pre-built templates, and workflow automation tools.

Zoho Creator is a popular low-code platform that allows users to rapidly develop business applications by designing forms, creating workflows, generating reports, and managing databases through a graphical interface. For advanced functionality, custom logic can be added using Deluge scripting.

Low-code development reduces development time, lowers costs, simplifies maintenance, and enables faster deployment compared to traditional development methods.

4. Diagram for Stages in Traditional Approach

Stages in Traditional Approach (SDLC)

Stages:

- Requirement Gathering
- System Analysis
- System Design
- Coding
- Testing
- Deployment
- Maintenance

5. Diagram for Steps in Low-Code

Steps:

- Define Requirements
- Create Application
- Design Forms
- Configure Database
- Build Workflows
- Add Business Logic (Deluge)
- Test Application
- Deploy
- Maintain and Update

6. Comparative Analysis between Traditional and Low-Code

Parameter	Traditional Development	Zoho Low-Code Development
Development Method	Manual coding	Visual drag-and-drop development
Coding	High	Low

Parameter	Traditional Development	Zoho Low-Code Development
Requirement		
Development Time	Weeks or months	Hours or days
Technical Skills	Advanced programming knowledge required	Basic programming knowledge sufficient
Development Cost	High	Low
Maintenance	Complex	Easy
Deployment	Manual	Quick cloud deployment
Database Management	Manual configuration	Built-in database support
Workflow Automation	Requires coding	Visual workflow builder
Customization	Very High	Moderate to High
Scalability	Highly scalable	Suitable for most business applications
Productivity	Moderate	High
Target Users	Professional software developers	Developers and business users

7. Result

The comparative study shows that Traditional Application Development offers greater flexibility and customization but requires extensive coding, skilled developers, and longer development time. In contrast, Zoho Low-Code Development enables rapid application development with minimal coding, reduced costs, and easier maintenance. Therefore, low-code platforms are well suited for developing business applications quickly, while traditional development remains the preferred choice for highly complex and customized software systems.
